Safe working practices when working on air conditioning systems
Safety gear prevents refrigerant splashing on skin or in eyes or being inhaled
Avoid open flames, which can cause the refrigerant to become corrosive and highly poisonous
Direct skin contact, treat for cold burn Run under tepid water for 10 minutes, if severe seek medical assistance
Ensure adequate ventilation as refrigerant is heavier then air and it will reduce the oxygen level in a confined area
Refrigerant splashed in eyes, do not rub, put tepid water on eyes, seek medical attention
